WHITEWISE INTERIOR FURNITURE

USER MANUAL

Interior Furniture Management System

Guide for administrators, staff, and customers

Document version	1.0 — Working draft
Prepared for	Whitewise Interior Furniture
Prepared	October 2026

This document describes the system using the screens, routes, and implementation details shared during development. Names and behavior of individual screens may vary with the deployed build.

Contents

- 1. Purpose and intended users
- 2. Accessing the application
- 3. Navigation and available sections
- 4. Administrator dashboard and user management
- 5. Product, inventory, room, order, and sales workflows
- 6. Billing and payment pages
- 7. Troubleshooting and safe-use practices
- 8. Support and feedback

1. Purpose and intended users

The Whitewise Interior Furniture Management System is a web application intended to support furniture-related browsing and internal management activities. The available interface includes room management, customer services, sales, orders, products, inventory, finished products, catalogue browsing, billing/payment pages, and account dashboards.

Intended users

- **Administrators:** review their account information and login history, manage user accounts, and open management sections.
- **Staff or operational users:** use the sections their account permissions allow, such as orders, sales, products, inventory, or rooms.
- **Customers:** use customer-facing pages made available by the deployed version, such as home, catalogue, login/signup where applicable, billing, and payment.

2. Accessing the application

For a local development installation, the React/Vite frontend has previously been run at **http://localhost:5173**. The backend API used by the administrator dashboard is configured at **http://localhost:9193**. These addresses apply only when the services are running locally; a hosted installation will use its own addresses.

Basic steps

- Open the application URL supplied by the system administrator.
- Sign in using the account credentials provided to you, if the selected page requires authentication.
- If you cannot sign in, check that the email/password are correct and that the backend is running. Do not share your password or authentication token.
- Use the navigation menu or dashboard buttons to open a section.

3. Navigation and available sections

Section	Local route	Typical purpose
Home	/	Landing page and entry point.
Existing Rooms	/existing-rooms	View existing room records.
Add Room	/add-room	Open room creation form.
Edit Room	/edit-room/:id	Edit a room selected by its ID.
Browse All Rooms	/browse-all-rooms	Browse room listings.
Room Dashboard	/dashboard	Open the room dashboard component.
Customer Services	/customer-services	Open customer-service functions.
Sales	/sales	Open sales functions.
Orders	/orders	View or manage orders.
Products	/products	Open product management.
Inventory	/inventory	Open inventory management.
Finished Products	/finishedproduct	Open finished-product functions.
Product Cards	/cardproduct	Display product cards.
Catalogue	/catalog	Browse the product catalogue.
Login	/login or /loginpage	Open one of the configured login pages.
Sign Up	/signup	Open the configured registration page.
Admin Dashboard	/admin/dashboard	Administrator information and user management.
User Dashboard	/user/dashboard	User dashboard.
Billing	/billing	Open billing form.
Payment	/payment	Open payment page.
About Us	/about-us	View company information.

Note: routes identify frontend pages; they do not guarantee that every user role can access every page. Access may be restricted by application logic or backend security.

4. Administrator dashboard and user management

The administrator dashboard includes account information and tools for managing application users.

Administrator profile and login history

- The profile area displays the signed-in administrator's name and email when the API returns them.
- The profile-picture control accepts an image file. Select an image and wait for the success message; if upload fails, retry or contact the developer.
- Select **Show Login History** to display recorded login timestamps. Select it again to hide the list.

Opening management sections

Use the Management Sections buttons to navigate to Customer Services, Sales, Orders, Products, Inventory, Dashboard, and Finished Products. Each button opens its configured route.

Users Management

- Select **Users Management** to show or hide the user-management panel.
- Select **Add User**, enter the required details, choose a role, and submit. Password and confirmation must match.
- To edit a user, select **Edit** in that user's row, update the form, then select **Update**. The selected user details should populate the form.
- To remove a user, select **Delete** and confirm the prompt. Deletion may be difficult or impossible to reverse.
- To reset a password, select **Reset Password**, enter the new password, and confirm.

Only perform user administration when authorized. Check the selected user's details carefully before updating, deleting, or resetting credentials.

5. Product, inventory, room, order, and sales workflows

The application provides separate routes for these areas. The exact fields and workflow depend on the screen currently deployed.

Rooms

- Use Add Room to open the room-creation screen.
- Use Existing Rooms or Browse All Rooms to find room records.
- Use the edit action for a record to open its edit route, which includes the record ID.

Products and inventory

- Open Products to use the product-management screen.
- Open Inventory to review or maintain stock information supported by that screen.
- Use Finished Products for the separate finished-product section.
- Check names, quantities, and other values before saving. Confirm that changes are reflected after the page reloads.

Orders and sales

- Open Orders to review the order workflow available to your account.
- Open Sales for the sales functions provided by the system.
- Use Customer Services for the customer-service functions implemented in that page.

Catalogue and customer pages

- Open Catalogue to browse products where that page is available.
- Use Billing and Payment only according to the company's approved process.
- Do not treat an on-screen payment message as proof of settlement unless the system's approved payment confirmation process verifies it.

6. Billing and payment pages

The frontend has routes for Billing and Payment. The exact payment provider, payment status checks, receipts, and refund procedures are not confirmed by the available implementation details. Follow the company's approved financial procedures and verify payment status through the designated system or provider before releasing goods.

7. Troubleshooting and safe-use practices

Problem	What to check
Page does not open	Confirm the frontend is running and use the correct route. Check the browser address and console for errors.
Sign-in or API returns 401	Sign in again, confirm the token is present and current, and verify the backend URL. A 401 usually indicates missing, invalid, or expired authentication.
User list does not load	Check backend availability, the administrator token, the /admin/users endpoint, and backend authorization rules.
Profile picture upload fails	Choose a valid image, check network/server errors, and verify that the backend accepts the field name 'file'.
A dashboard button opens an error	Confirm the target route exists in App.jsx and the page component compiles. Check role permissions and browser console.
Changes do not appear	Refresh the page after confirming the save succeeded. Check for validation errors and server-side errors.

Safe-use checklist

- Keep passwords private and sign out on shared devices.
- Do not upload customer or business data unless you are authorized to do so.
- Double-check records before deleting or changing user roles.
- Report unexpected behavior with the page name, time, and a screenshot that does not expose passwords or tokens.

8. Support and feedback

For help, contact the system administrator or the person responsible for maintaining the application. Include the page/route, what you were trying to do, the exact error message, and the steps to reproduce it. Never send passwords, secret keys, or bearer tokens in a support request.
